                                                                                                                                                                                                                                                                                                                                  The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725-ABB08725) comprising at least one NEWO binding domain (ABB77313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO interaction results in inhibition of IKCheta kinase activation and subsequent decreased phosphorylation of IKCheta kinase activation and subsequent decreased phosphorylation of IKCheta kinase activation and subsequent decreased phosphorylation of IKCheta kinase activation and cat (directly or indirectly) by blocking the recruitment of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast differentiation. The compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, Alzheiner's disease, atherosoclerosis, a viral infection or ataxia telanglectasia. The inflammatory disorder is asthma, allergies, urticaria, anaphylaxis, cutaneous inflammation, sepsis, psoriasis, changementials, osteoarthritis, psoriatic arthritis, lupus and bursitis. The inflammatory disorder may also be dermatitis, esteroatrhitis, psoriatic arthritis, lupus and spondylarthritis Also for Crohn's disease, ulcerative colitis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, cryolobulinamenia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other diseases include HIV and influenza. The compound may also be useful for sunburn or aging. The compound way be used to replace corticosteroids in which corticosteroids are used, including inflammatory compounds and food sensitivity. Also for identifying any application in which corticosteroids are used, included in which corticosteroids are used, included in which corticosteroids are used.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEMO binding domain of IKKOeta.
                                                                                                                                                                                                           Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

AMM48620-AMM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48627) or AAM48651 which comprises from 6-15 amino acid residues, fueed to a NEWO binding sequence correction, antiposoriatic, antitheumatic, antiarthritic, osteopathic, cartiposoriatic, antirheumatic, antiarthritic, osteopathic, cartiposoriatic, antirheumatic, antiarthritic, osteopathic, noctropic, antiatherosoleroric, virucide and antiallergic activity. The compounds act as selective inhibitors of Cytokine-mediated NFkappaB comparation by blocking interaction of IkappaB kinase beta (IKKObeta) at the NEWO binding domain that results in inhibition of IKKOpeta kinase activation and subsequent decreased phosphorylation of IkappaB. The compounds are useful for treating inflammatory discretery discretery, seteoarthritis, inflammatory bowel disease, sepsis, vasculitis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, caranulomatosis, authorosclerosis, transplant rejection; osteoporosis; telangiectasia. The compounds are also useful for treating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               anaphylaxis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
The invention relates to an antiinflammatory compound (especially

```
NEWO binding domain (NBD) peptides. The NEWO binding domains are found on IkappaB kinase-beta (IKKDeta) and IkappaB kinase-alpha found on IkappaB kinase-beta (IKKDeta) and IkappaB kinase-alpha are useful for modularing nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKapha or IKKDeta, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating hiflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzheimer's disease, atterosclerosis, viral infections. Attain telangiectasia, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basel activity of NF-kappaB. ABU08418-ABU08432 represent human

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound comprises contacting a cell with an anti-inflammatory compound (ABB077313). The compound has acts through selective inhibition of KAB077313). The compound has acts through selective inhibition of KAB077313. The compound has acts through selective inhibition of NEMO interaction results in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IKRDeta kinase activation and subsequent decreased phosphorylation of IKRDeta kinase activation and subsequent decreased phosphorylation of IKRDeta kinase activation and chronic inflammation, by down-regulating the expression of E-selection on leukocytes or by blocking osteoclast differentiation. The compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder, and autoimmune disease, transplant rejection, osteoporosis, cancer, although architis, osteoarthritis, psoriatic arthritis, psoriatis, and arthritis, psoriatis, and arteritis, inflammatory disease, ulcerative colitis, psoriatis, and arteritis, psoriatis, and sporylation arteritis, psoriatis, and sporylation arteritis, psoriatis are propound and perges almplex. Other viral infections caused by Epstein-barr, cytomegalovirus or herpes aimplex. Other viral diseases include HIV and influenza. The compound may also be useful for
                                                                                                                                                                       kinase activation; leukocyte; inflammation; B-selectin; osteoclast; autoimmune disease; transplant rejection; osteoporosis; cancer; Alzheimer's disease; viral; infection; asthma; anaphylaxis; psoriasis; rheumatoid arthritis; Crohn's disease; multiple sclerosis; HIV; corticosteroid; immunosuppression; antiinflammatory; immunosuppression; osteopathic; cytostatic; noctropic; neuroprotective; anti-HIV; human; antiarteriosclerotic; virucide; antiasthmatic; antiallergic; dermatological; antibacterial; antisoxiatic; antirheumatic; antialtarthritic; osteopathic; antiulcer; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Modulating NP-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting cell with an anti-inflammatory compound comprising at least one NEMO

AAH84373 to AAH84499 represent Escherichia coli growth and proliferation related DNA sequences (I). AAH84500 to AAH84670 encode the E. coli growth and proliferation related proteins given in AAG9908 and AAG98830 to AAG98999. (I) can be used as potential targets for the generation of interact with the gene products of (I). In addition the expression of interact with the gene products of (I). In addition the expression of (I) and the purification of the proteins, the purified proteins can be used to generate reagents and screen small molecule libraries or other candidate compound libraries for compounds that can be further developed to yield novel antimicrobial compounds. In addition, nucleic acid probes complementary to (I) that are specific for particular species of microorganisms can be used to identify particular microorganism species (in clinical speciens), therefore, providing a rapid and dependable method by which to identify the causative agents of a bacterial infection. Also, antibodies generated against proteins translated from
                                                                                                                                                                                                                                                                                                                       ö
treating anaphylaxis, drug and food sensitivity, contact dermatitis, sunburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of an IKKbeta mutant, useful in examples of the invention.

Note: The present sequence is not given in the specification but is derived from GenBank Accession No. 014920 (ABB77294).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    E. coli growth and proliferation related protein sequence SEQ ID NO:432.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel nucleic acids that inhibit Escherichia coli proliferation, useful for screening for homologous genes and for designing expression vectors
                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    other secondary metabolic products, improving the yield of everninomicins and to produce novel everninomicins and also as a hybridisation probe to identify homologous sequences. The encoded polypeptides are useful for combinatorial biosynthesis to generate libraries of orthomycins, e.g. everninomicin analogues/homologues and drug discovery. The DNA encoding the integrase allows for increasing a given gene dosage. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid molecules encoding everninomicin pathway gene products, useful for improving yields of everninomicin, to produce new everninomicin and as probes to identify homologous sequences -
mRNA transcribed from proliferation-required sequences can also be use to screen for specific microorganisms that produce such proteins in a species specific manner. AAH84371 and AAH84670 represent sequencing primers used in the isolation of B. coli growth and proliferation related sequence, which are used in an example from the present
                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      encoded by a resistance mechanism

integrative vector can be used to permanently integrate copies of a heterologous game of choice into chromosomes of different hosts and to integrate genes which increase the yield of known products or to generate novel products such as hybrid antibiotics or other novel secondary metabolites. The vector can also be used to integrate antibiotic resistance genes in order to carry out biconversions with compounds to which the strain is normally sensitive and is thus useful in fermentation processes involving e.g. Streptomyces antibioticus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB08725-ABB08742) comprising at least one NEMO binding domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                IKKbeat; IKKalpha; NEMO; NEMO binding domain; NBD; NF-kappaB; NF-kB; kinase activation; leukocyte; inflammation; E-selectin; osteoclast; autoimmune disease; transplant rejection; osteoprosas; cancer; Alzheimer's disease; viral; infection; asthma; anaphylaxis; psoriasis; rheumatoid arthritis; Crohn's disease; multiple sclerosis; HIV; corticosteroid; immunosuppression; antiinflammatory; immunosuppressive; osteopathic; cytosteatic; nootropic, neuroprotective; anti-HIV; human; antiarteriosclerotic; virucide; antiasthmatic; antiallergic; dermatological; antibacterial; antiboriatic; antiallergic; antialregic; antialregic; antiatrhritic; osteopathic; antiulcer; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ø
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting cell with an anti-inflammatory compound comprising at least one NEMO

CC (ABB77113). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO with INKROEta at the NEMO binding domain. Blockage of INKROETA-NEMO interaction results in inhibition of INKAGETA kinase activation and subsequent decreased phosphorylation of INKAGETA kinase activation and cube (directly or indirectly) by blocking the recruitment of leukocytes are into sites of acute and chronic inflammation, by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast differentiation. The compound is useful in treating NF-kB mediated conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, allocimacio atthritis, conditions, an inflammatory disorder, and autoimmune disease, atherosclerosis, a viral infection or ataxia telangiectasia. The inflammatory disorder is asthma, allergies, conditional anaphylaxis, cuteneous inflammatory disease, rethritis, osteoarthritis, osteoarthritis, posteoarthritis, posteoarthritis, posteoarthritis, posteoarthritis, inflammatory disorder may also be dermatitie, eczema, posteoarthritis, socieoarthritis, posteoarthritis, posteoarthritis, undisorder may also be dermatitie, eczema, posteoarthritis, socieoarthritis, posteoarthritis, posteoarthritis, socieoarthritis, so

```
The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEMO binding domains are found on IkappaB kinase-beta (IKKDeta) and IkappaB kinase-alpha (IKKAlpha) proteins. The antiinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKS such as IKKalpha or IKKDeta, and NEMO. The
                                                                                                                                                                                                                                                                                                        Novel antiinflammatory peptide compounds comprising NEMO binding domain, useful for modulating NF-kappaB induction in a cell and for treating NF-kappaB-mediated inflammation disorders e.g., asthma, psoriasis, vasculitis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating inflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, viral infections, Ataxia telangiectasis, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. ABU08418-ABU08432 represent human NBD mutant peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, chromosome mapping, gene mapping, gene therapy, forensic; food supplement, medical imaging, diagnostic, genetic disorder.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to an antiinflammatory compound (especially AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48645), residues, fused to a NEWO binding sequence (CAM48625-AAM48619). The antiinflammatory compounds have antiasthmatic, antipacterial, immunosuppressive, dermatological, neuroprotective, nootropic, antiaherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKAbeta kinase activation and subsequent decreased phosphorylation of IKAbeta kinase activation and subsequent decreased phosphorylation of IKAbeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammatory nowel disease, sepsis, vasculitis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, osteoarthritis, inflammatory besis, transplant rejection; and ataxia telangiectasia. The compounds are also useful for treating pro-inflammatory responses such as allergies, urticaria, anaphylaxis, pro-inflammatory responses such as allergies, urticaria, anaphylaxis, pro-inflammatory responses such as allergies, urticaria, anaphylaxis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      IkappaB kinase-beta; IkappaB kinase-alpha; IKKalpha; NF-kappaB, nuclear factor-kappaB induction; inflammatory disorder; autoimmune disease; osteoporosis; cancer; Alzheimer's disease; atherosclerosis; viral infection; Ataxia telangiectasia; transplantation detection; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; antiatherosclerotic; virucide; vasotropic; antirheumatic; antiathritic; mutant; mutein.
                                                                                                                                                                                Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The careful as also used in diagnostics as expressed sequence tags to restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of stress expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences or other invention.

Cand to produce other types of the invention can be be printed diagnostic amino acid sequences of the invention but was obtained in electronic format directly from WIPO can every second or sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaccino (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The cand gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for restore normal activity of (II) or to treat disease states involving to restore normal activity of (II) or to treat disease states involving a polymetric for in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in disorders of generate disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human can appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gape
                                                                                                      New isolated polynuclectide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                    à
                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                          Recombinant or substantially pure preparations of H. pylori polypeptides are disclosed, together with the nucleic acids encoding them. In all, 97 ORFs are shown. The proteins are variously cell envelope proteins, cytoplasmic proteins, secreted proteins or other cellular proteins, vaccines containing the nucleic acids or proteins are claimed, as are probes containing at least 8 nucleotides from the nucleic acid sequences. The vaccines are useful for treating or reducing the risk of H. pylori infections, and the probes can be used diagnostically for detecting the presence of Helicobacter in a sample. The products are also of use in screening for compounds having the ability to interfere with the H. pylori life cycle or to inhibit H. pylori infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a new Helicobacter pylori bacterium having a mutation that affects lipopolysaccharide (LPS) biosynthesis, where either LPS is not expressed or LPS which is expressed does not induce antibodies which cross-react with human self epitopes. The invention is useful for treating or preventing, and in the manufacture of a vaccine for treatment or prophylaxis of Helicobacter pylori
                                products for the diagnosis, prevention and treatment of infection by H. pylori and other Helicobacter species

(II) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the s. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides (II) (and/or nucleic acids) may then be polypeptides (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent objectide sequences from the present invention. AAH55091 to AAH55091 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4465 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides
infection. The vaccine does not induce antibodies which cross-react with human self epitopes. The present amino acid sequence repersents the Helicobacter pylori LPS biosynthesis enzyme HP1031 that was isolated from strain J99 and was used in the methods of the invention.
                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acids encoding polypeptides from Staphylococcus epidermidis, useful for vaccinating against infections, e.g. endocarditis -

    S. epidermidis open reading frame protein sequence SEQ ID NO:2648.

                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Staphylococcus epidermidis SR1 strain; infection; diagnosis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP315124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

NB. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the USPTO web site.
                                                                                                                                                                                                                                                                                                Staphylococcus epidermidis; open reading frame; ORF; bacterial infection; antibacterial; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                         sulfate permease family protein [imported] - Nostoc sp. (strain PCC 7120)
C;Species: Nostoc sp. PCC 7120
A;Note: Nostoc sp. strain PCC 7120
A;Note: Nostoc sp. strain PCC 7120 is a synonym of Anabaena sp. strain PCC 7120
C;Accession: AE1969

probable glycolate oxidase - Streptomyces coelicolor
C;Species: Streptomyces coelicolor
C;Date: 03-Dec-1999 #sequence_revision 03-Dec-1999 #text_change 28-Jul-2000
C;Accession T36246
R;Saunder, D.C.; Harris, D.; Bentley, S.D.; Parkhill, J.; Barrell, B.G.; Rajandream, M..
submitted to the EMBL Data Library, March 1999
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        integral membrane protein HP0228 homolog 2 - Synechocystis sp. (strain PCC 6803)
N;Alternate names: low affinity sulfate transporter; protein slr0096
C;Species: Synechocystis sp.
A;Variety: PCC 6803
C;Date: 25-Apr-1997 #sequence_revision 25-Apr-1997 #text_change 20-Jun-2000
C;Accession: S76624

```
The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB087721-ABB08725-ABB08742) comprising at least one NEWO binding domain (ABB77313). The compound has acts through selective inhibition of (ABB0877313). The compound has acts through selective inhibition of vytokine-mediated NF-kB activation by blocking the interaction of NEWO with INKObeta at the NEWO binding domain. Blockage of IKKbeta-NEWO interaction results in inhibition of IKKbeta kinase activation and subsequent decreased phosphorylation of IKKbeta kinase activation and subsequent decreased phosphorylation of IKKbeta kinase activation and cat (directly or indirectly) by blocking the recruitment of leukocytes cat differentiation. The compound is useful in treating NF-kB mediated cat cate sites of acute and chronic inflammation, by down-regulating the expression of E-selection on leukocytes or by blocking osteoclast differentiation. Where the compound is useful in treating NF-kB mediated conditions, where the compound is useful in treating of isoase, atherosclerosis, a viral infection or ataxia autoimmune disease, ratherosclerosis, a viral infection or ataxia categoricaria, anaphylaxis, cutaneous inflammatory disease, vasculitie and cuticaria, anaphylaxis, cutaneous inflammatory disease, vasculities and cuticaria, anaphylaxis, cutaneous inflammatory disease, vasculities and colling booriatis are architis, psoriatis, psoriatis, psoriatis, psoriatis, psoriatis, creaming or multiple sclerosis. For chronic obstructive or herpes simplex. Other viral cypolymyalgia, scleroderma Wegner's granulomatosis, temporal arteritis, cryomegalovirus or herpes simpled HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, cumburn or aging. The compound may be useful for the propound may be deministered alone or in combination with other known catiinflammatory agents. The present sequence is that of a mutated NEW Paterior. 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

(AAM48525-AAM48619). The antiinflammatory compounds have antiaethmatic, cytostatic, antiperentic, antirheumatory compounds have antiaethmatic, antibacterial, immunosupressive, dermatological, neuroprotective, antibacterial, immunosupressive, dermatological, neuroprotective, nootropic, antiatherosclerotic, virucide and antiallergic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB activation by blocking interaction of KappaB kinase beta (IKKDeta) at the NEWO binding domain that results in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IKKDeta kinase compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, costeoporesis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, grannlomatosis, multiple sclerosis; transplant rejection; osteoporosis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention relates to antiinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEWO binding domains are found on IkappaB kinase-beta (IKMCALs) and IkappaB kinase-beta (IKMCALs) and IkappaB kinase-alpha cound on IkappaB kinase-beta (IKMCALs) and IkappaB kinase-alpha are useful for modulating nuclear factor kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction in a cell, where the compounds are useful for modulating and IKMCALs, and NEMO. The antiinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating in a finiammatory disease, atherosclerosis, viral infections, Ataxia telangiecterasis, and for transplantation detection. The compounds of the invention block NF-kappaB induction by IKK but do not inhibit the basal activity of NF-kappaB. ABU08412 represent human
                                                                                                                                            IkappaB kinase-beta; IkappaB kinase-alpha; IKKalpha; NF-kappaB; nuclear factor-kappaB induction; inflammatory disorder; autoimmune disease; osteoporosis; cancer; Alzheimer's disease; atherososis; viral infection; Ataxis telangiectasia; transplantation detection; immunosuppressive; osteopathic; cytostatic; nootropic; neuroprotective; antiatherosolerotic; virucide; vasotropic; antirheumatic; antiathatic; mutant; mutein.

Modulating NF-kappaB induction in a cell, useful for treating e.g. inflammatory disorders, osteoporosis and cancer, comprises contacting a cell with an anti-inflammatory compound comprising at least one NEMO binding domain

Example 11; Page -; 82pp; English.

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB077313). The comprision at least one NEMO binding domain (ABB077313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO cytokine-mediated NF-kB activation by blocking the interaction of NEMO conflains domain. Blockage of IKKDeta-NEMO interaction results in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IKKDeta kinase activation and interaction results in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IKKDeta kinase activation and cat (directly or indirectly) by blocking the recruitment of leukocytes into sites of acute and chronic inflammation, by down-regulating the expression of B-selectin on leukocytes or by blocking osteoclast conflictions, where the compound is useful in treating osteoclast conflictions, where the complition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, autoimmune disease, transplant rejection, osteoporosis, cancer, contingual anaphylaxis, cutaneous inflammatory disorder and allergies, urticaria, anaphylaxis, cutaneous inflammation, sepsis psoriasis, crematicis, osteoarthritis, psoriatic arthritis, lupus and the susting soriatic arthritis, lupus and susting sporiations of spondylarthritis. Also for Crohn's disease, ulcerative colitis, spondylarthritis. Also for Crohn's disease, ulcerative colitis, spondylarthritis, shortederma, wegner sprandown and anaphylaxis, drug and food sensitivity, contact dermatitis, creating anaphylaxis, drug and food sensitivity, contact dermatitis,

ô
sunburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of an IKKbeta mutant, useful in examples of the invention.

Note: The present sequence is not given in the specification but is derived from GenBank Accession No. 014920 (ABB77294).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequences AAU39105-AAU68017 represent Propionibacterium acnes immunogenic polypeptides. The proteins and their associated DNA sequences are used in the treatment, prevention and diagnosis of medical conditions caused by P. acnes. The disorders include SAPHO syndrome (synovitis, acne, pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory presence or absence of P. acnes in a patient comparises contacting the sample with a binding agent that binds to the proteins of the invention and determining the amount of bound protein in the sample. The

The proteins have antibacterial and antiinflammatory activity. (1), nucleic acids encoding (1), ABN6604-ABN71526 and antibodies that bind (1) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (1) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to (1). A composition comprising (1) or a nucleic acid encoding (1), may be
polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downrequlate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5483 sequences (31, given in the specification. The proteins have antibacterial and antinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to biological sample. (I) is used to anucleic acid encoding (I), may be used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gарв

The invention relates to modulating NF-kappaB (NF-kB) induction in a cell comprises contacting a cell with an anti-inflammatory compound (ABB008725-ABB08742) comprising at least one NBMO binding domain (ABB77313). The compound has acts through selective inhibition of cytokine-mediated NF-kB activation by blocking the interaction of NEMO interaction results in inhibition of IKKDeta kinase activation and subsequent decreased phosphorylation of IKKDeta kinase activation and subsequent decreased phosphorylation of IKMDeta kinase activation the compound subsection by down-regulating the expression of E-selectin on leukocytes or by blocking osteoclast conditions, where the condition is an inflammatory disorder, an autoimmune disease, transplant rejection, osteoporosis, cancer, alteriance, alternation, selection or ataxia telangiectasia. The inflammatory disorder is asthma, allergies, cheumatory disease, chronic obstructive pulmonary disease, vasculitis and bursitis. The inflammatory disorder may also be dermatitis, eccema, psoriasis, osteoarthritis, psoriatic arthritis, lupus and psoriasis, osteoarthritis, lupus and

spondylarthritis. Also for Crohn's disease, ulcerative colitis, polymyalgia, scleroderma, Wegner's granulomatosis, temporal arteritis, cryoglobulinaemia or multiple sclerosis. For chronic viral infections caused by Epstein-barr, cytomegalovirus or herpes simplex. Other viral diseases include HIV and influenza. The compound may also be useful for treating anaphylaxis, drug and food sensitivity, contact dermatitis, subburn or aging. The compound may be used to replace corticosteroids in any application in which corticosteroids are used, including immunosuppression in transplants and cancer therapy. Also for identifying antiinflammatory compounds and for diagnosis of an inflammatory disorder. The compound may be administered alone or in combination with other known anti-inflammatory agents. The present sequence is that of a mutated NEMO binding domain of IKKbeta. Antiinflammatory; antiasthmatic; cytostatic; antipsoriatic; nootropic; antirheumatic; antiarthritic; osteopathic; antibacterial; virucide; immunosuppressive; dermatological; neuroprotective; antiatherosclerotic; antiallergic; membrane translocation domain; NEMO binding domain; eczema; cytokine; NFkappaB; IkappaB kinase beta; IKKbeta; cancer; psoriasis; rheumatoid arthritis; osteoarthritis; inflammatory bowel disease; autoimmune disorder; multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infection; ataxia telangiectasia; allergy; anaphylaxis; arthritis. Novel antiinflammatory compound comprising membrane translocation domain fused to NEMO binding sequence, useful for blocking nuclear factor kappaB activation, and for treating asthma, lung inflammation, Gaps The invention relates to an antiinflammatory compound (especially AAM48628-AAM48645), comprising a membrane translocation domain (AAM48620-AAM48627 or AAM48646-AAM48651) which comprises from 6-15 ö 91.4%; Score 32; DB 23; Length 6; 83.3%; Pred. (AAM48625-AAM88619). The antiinflammatory compounds have antiasthmatic, cytostatic, antipsoriatic, antintheumatic, antiarrhitic, osteopathic, antibactatic, antipsoriatic, antintheumatic, antiarrhitic, osteopathic, notropic, antiatherosclerotic, vincide and antiallargic activity. The compounds act as selective inhibitors of cytokine-mediated NFkappaB cativation by blocking interaction of IkappaB kinase beta (IKKbeta) at the NEWO binding domain that results in inhibition of IKKbeta antians and subsequent decreased phosphorylation of IKAppaB. The compounds are useful for treating inflammatory disorders, e.g. asthma, lung inflammation or cancer, psoriasis, rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, sepsis, vasculitis, bursitis, autoimmune diseases such as lupus, polymyalgia, scleroderma, granulomatosis, multiple sclerosis; transplant rejection; osteoporosis; Alzheimer's disease; atherosclerosis; viral infections; and ataxia telanglectasis. The compounds are also useful for treating pro-inflammatory responses such as allergies, unticaria, anaphylaxis, arthritis or food sensitivity, eczema, dermatitis, sunburn, aging and

                                                 The present invention relates to antinflammatory compounds comprising NEMO binding domain (NBD) peptides. The NEMO binding domains are found on IkappaB kinase-beta (IKKbeta) and IkappaB kinase-alpha (IKKalpha) proteins. The antinflammatory compounds of the invention are useful for modulating nuclear factor-kappaB (NF-kappaB) induction in a cell, where the compounds are capable of blocking the interaction between one or more IKKs such as IKKalpha or IKKbeta, and NEMO. The antinflammatory compound further comprises at least one membrane translocation domain. The compounds are useful for treating
                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                         inflammatory disorders, autoimmune diseases, osteoporosis, cancer, Alzheimer's disease, atherosclerosis, viral infections, Ataxia telangiectasis, and for transplantation detection. The compounds of the invention block NP-kappas Induction by IKK but do not inhibit the basal activity of NP-kappas. ABU08418-ABU08432 represent human NBD mutant peptides.
                                                                                                                                                                                                                                                                                                                                     ö

Isolated polypeptide for treating, preventing and or prognosing disorders related to the musculoskeletal system including musculoskeletal cancers and also for testing and detection e.g. diagnosis

Claim 11; SEQ ID NO 1782; 781pp + Sequence Listing; English.

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB01087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the disgnossis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colifis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention describes an isolated mucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypeptides useful confluence or cancer metastases, in animals or the nucleic acid: stimulates re-vascularisation of isohaemic tissues associated with conditions; treats wounds due to injulies, and other cardiovascular conditions; treats wounds due to injulies, and other cardiovascular conditions; treats wounds due to injulies, and limb regenerative tissue repair, and ulcers; stimulates angiogenesis and limb regeneration; stimulates neuronal growth; can treat and prevent contitions, such as, Alzheimer's disease, Parkinson's disease, and AIDS-related complex; stimulates chondrocyte growth, thus they can be conditions, such as, Alzheimer's disease, Parkinson's disease, and AIDS-related complex; stimulates chondrocyte growth, thus they can be cused to enhance bone and periodontal regeneration and aid in tissue transports or bone grafts; prevents skin aging due to sunburn by stimulating keratinocyte growth; prevents hair loss, since FGF family estimulates growth and differentiation of hematopoietic cells and bone marrow cells when used in combination with other cytokines; maintains cignas before transplantation or for supporting cell culture of primary tissues; induces tissue of mesodermal origin to differentiate in early embryonic stem cells, besides, hematopoietic lineage; modulates mammalian characteristics such as, body height, weight, hair colour, eye colour, skin, percentage of adipose tissue, pigmentation, size, and shape (e.g., cosmetic surgery); modulates mammalian metabolism; changes mammal's metal state or physical state by influencing biorhythms, caricadic rhythms, depression, tendency for violence, tolerance for pain, reproductive capabilities, hormonal or endocrine levels, appetite, contour, everyment, lipid, protein, caricades the menry, or stress; increases the productive violence of a contour contour contour chem untitional components. This is the amino acid sequence of a coro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  novel human musculoskeleral system antigen.
Note: The sequence data for this patent did not form part of the
printed specification, but was obtained in electronic format directly
Isolated nucleic acid molecules encoding musculoskeletal system associated polypeptides, useful for detecting disorders, e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ftp.seqdata.uspto.gov/sequence.html?DocID=20020147140.

Score

Result

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Total number of hits satisfying chosen parameters:

Minimum DB seq length: 0 Maximum DB seq length: 200000000

Post-processing: Minimum Match 0% Maximum Match 100% Listing first 45 summaries

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PLACENTA AND PANCREAS.

DISEASE: Defects in PRODH are the cause of type I hyperprolinaemia [MIM:239500]; a disorder characterized by elevated serum proline levels. May be involved in the psychiatric and behavioral phenotypes associated in the 22q11 velocardiofacial syndrome. SIMILARITY: BELONGS TO THE PROLINE OXIDASE FAMILY.
                                                                                                                                                                                                                   Nadler J.V., Karayiorgou M.;

Serum amyloid P-component precursor (SAP) (9.5S alpha-1-glycoprotein).
                                                                                                                                                                                                                                                                                                           Nat. Genet. 21:434-439 (1999).
-!- FUNCTION: CONVERTS PROLINE TO DELTA-1-PYRROLINE-5-CARBOXYLATE.
-!- PATHWAY. CONVERTS EACH From proline to glutamate; first step.
-!- SUBCELLULAR LOCATION: Mitochondrial matrix.
-!- TISSUE SPECIFICITY: EXPRESSED IN LUNG, SKELETAL MUSCLE AND BRAIN,
TO A LESSER EXTENT IN HEART AND KIDNEY, AND WEAKLY IN LIVER,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Oxidoreductase, Proline metabolism; Mitochondrion, Transit peptide.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
